General information	44

Features

- Variable axial piston pump in swash plate design for hydrostatic drives in open circuits
- Flow is proportional to drive speed and displacement. The flow is infinitely variable by adjustment of the swash plate.
- Strong bearings for long service life
- High permissible drive speeds
- High power to weight ratio
- Small dimensions
- Low noise level
- Good suction characteristics
- Axial and radial loading of drive shaft possible
- Pressure and flow control
- Electro-hydraulic pressure control
- Power control
- Electro-proportional displacement control
- Short response times

Hydraulic fluids

Prior to project design, please see our technical data sheets RE 90220 (mineral oil), RE 90221 (environmentally acceptable fluids) and RE 90223 (HF-fluids) for detailed information on fluids and operating conditions.

When using HF- or environmentally acceptable fluids attention must be paid to possible limitations of the technical data, if necessary contact us. (when ordering please state in clear text the fluid to be used). Operation on Skydrol is only possible after consultation with us.

Operating viscosity range

For optimum efficiency and service life we recommend that the operating viscosity be chosen in the range of:

$$v_{\text{opt}} = \text{opt. operating viscosity } 80 \dots 170 \text{ SUS (16 ... 36 mm}^2\text{/s)}$$

referred to tank temperature (open circuit).

Limit of viscosity range

For critical operating conditions the following values apply:

$$v_{\text{min}} = 60 \text{ SUS (10 mm}^2\text{/s)}$$

for short periods ($t \leq 1 \text{ min}$)
at max. permissible leakage fluid temperature of
239 °F (115 °C).

Please note, that the max fluid temperature of 239 °F (115 °C) is also not exceeded in certain areas (for instance bearing area) The fluid temperature in the bearing area is approx. 7 °F (5 K) higher than the average leakage fluid temperature.

$$v_{\text{max}} = 7500 \text{ SUS (1600 mm}^2\text{/s)}$$

for short periods ($t \leq 1 \text{ min}$)
on cold start
($t_{\text{min}} = p \leq 435 \text{ psi (30 bar)}$), $n \leq 1000 \text{ rpm}$,
-13 °F (-25 °C))

At temperatures between -13 °F (-25 °C) and -40 °F (-40 °C) special measures may be required, depending on installation conditions. Please consult us for further information.

For detailed information on operation with low temperatures see data sheet RE 90300-03-B.

Selection diagram

Notes on the selection of the hydraulic fluid

In order to select the correct fluid, it is necessary to know the operating temperature in the tank (open circuit) in relation to the ambient temperature.

The fluid should be selected so that within the operating temperature range, the viscosity lies within the optimum range (v_{opt}), see shaded section of the selection diagram. We recommend to select the higher viscosity grade in each case.

Example: at an ambient temperature of X °F (X °C) the operating temperature in the tank is 140 °F (60 °C). In the optimum viscosity range (v_{opt} ; shaded area) this corresponds to viscosity grades VG 46 resp. VG 68; VG 68 should be selected

Important: The leakage fluid (case drain fluid) temperature is influenced by pressure and input speed, and is always higher than the tank temperature. However, at no point in the circuit may the temperature exceed 239 °F (115 °C).

If it is not possible to comply with these conditions because of extreme operating parameters or high ambient temperatures, please consult us.

Filtration of fluid

The finer the filtration the better the achieved cleanliness of the hydraulic fluid and the longer the life of the axial piston unit.

To ensure a reliable functioning of the axial piston unit, a minimum cleanliness of

20/18/15 to ISO 4406 is necessary.

At very high operating temperatures (195 °F (90 °C) to max. 239 °F (115 °C)) a cleanliness of

19/17/14 to ISO 4406 is necessary.

If above mentioned grades cannot be maintained please consult us.

Technical data

Operating pressure range

Inlet

Absolute pressure at port S

$p_{abs \min}$ _____ 12 psi (0,8 bar)

$p_{abs \max}$ _____ 73 psi (5 bar)

To determine the min. required inlet pressure p_{abs} at inlet port S or the reduction of displacement at higher input speeds see the diagram to the right.

Outlet

Pressure at port B

Nominal pressure p_N _____ 3600 psi (250 bar)

Peak pressure p_{max} _____ 4600 psi (315 bar)

(Pressures to DIN 24312)

Direction of flow

S to B.

Case drain pressure

Maximum permissible case drain pressure (port L, $L_{1/2}$):

maximum 7 psi (0,5 bar) higher than the inlet pressure at port S, however not higher than 29 psi (2 bar) absolute.

$p_{L \text{ abs max}}$ _____ 29 psi (2 bar)

Maximum permissible speed (Speed limit)

Permissible speed by increase of inlet pressure p_{abs} at the inlet port S or reduction of displacement ($V_g \leq V_{g \max}$).

Technical data

Weight approx. (without fluid)	m	lbs (kg)	17 (8)	25 (11,5)	31 (14)	40 (18)	48.5 (22)	75 (34)

¹⁾ Values are valid with inlet pressure of 15 psi (1 bar) at suction inlet S. With reduced displacement or increased inlet pressure the drive speed can be increased according to the diagram on page 5.

²⁾ For higher drive speeds please consult us.

³⁾ – These values are valid for conditions between the min. required and the max. permissible drive speeds.

For external sources of excitation (eg. diesel engine 2-8 fold rotary frequency, cardan shaft 2 fold rotary frequency).

– The limit is valid for a single pump.

– The load carrying capacity of the connecting parts must be taken into consideration.

Caution: Exceeding these limits can lead to a loss of operability, reduction of service life or complete destruction of the axial piston unit. The permissible values can be calculated.

Technical Data

Determination of pump size

Flow	$q_v = \frac{V_g \cdot n \cdot \eta_v}{231 (1000)}$	[gpm (L/min)]	V_g = geometr. displacement per revolution in in ³ (cm ³)

DR - Pressure control

The pressure control serves to maintain a constant pressure in the hydraulic system, within the control range of the pump. The pump therefore supplies only the amount of hydraulic fluid required by the actuators. The pressure can be steplessly set at the pilot valve.

Static characteristic

at $n_1 = 1500 \text{ rpm}$; $t_{\text{fluid}} = 120 \text{ °F (50 °C)}$

Dynamic characteristic

The curves show average measured values under test conditions.

Conditions: $n = 1500 \text{ rpm}$
 $t_{\text{fluid}} = 120 \text{ °F (50 °C)}$
 Line main relief set at 4570 psi (315 bar)

Stepped loading by suddenly opening or closing the pressure line using a pressure relief valve at 3.3 ft (1 m) downstream from the pump pressure outlet.

Schematic: DR

DRG - Pressure control, remote

The DRG-control valve enables a remote setting of max. pump pressure below the setting of the DR-, control spool, see page 9.

For the remote setting of pressure it is necessary to pipe an external relief valve to port X. This valve is not included in the supply of the pump.

The differential pressure at the DRG-spool is set as standard to 290 psi (20 bar), and this results in a pilot flow of approx. 0.4 gpm (1,5 L/min). If another setting is required (range between 145 and 320 psi (10 and 22 bar)), please state in clear text.

As a separate pressure relief valve we can recommend:

- DBDH 6 (hydraulic) to RE 25 402 or
- DBETR -SO381 with orifice dia. 0.03 inch (0,8mm) in P (electric) to RE 29 166

The max. length of piping should not exceed 6.6 ft (2 m).

Control data

See page 9

Schematic: DRG

DRF (DFR) and DRS (DFR1) - pressure and flow control

Execution of control valve as described on page 9 and 10.

In addition to the pressure control function, the pump flow to the actuator may be varied by means of a differential pressure (eg. over an orifice or a directional valve). The pump supplies only the amount of fluid as required by the actuator.

The pressure control overrides the flow control function.

The DRS (DFR1) has no connection between X-port and Tank.

Static characteristic

Flow control at $n_1 = 1500 \text{ rpm}$; $t_{\text{fluid}} = 120 \text{ °F (50 °C)}$

Static characteristic at variable speed

Dynamic characteristic of flow control

The curves are measured average values under test conditions

- B Outlet port
- S Inlet port
- L, L₁ Case drain ports (L₁ plugged)
- X Pilot pressure port

Differential pressure Δp

Standard setting: 200 psi (14 bar). If a different setting is required please state in clear text.

When port X is unloaded to tank (and outlet B is closed) a zero stroke pressure ("standby") of $p = 260 \pm 30 \text{ psi (18} \pm 2 \text{ bar)}$ results (depends on Δp -setting).

Control data

For pressure control see page 9.

Max. flow deviation (hysteresis and rise) measured at a drive speed of $n = 1500 \text{ rpm}$.

Size	10	18	28	45	63	85
$\Delta q_{v\text{max}}$	0.13	0.24	0.26	0.48	0.66	0.83
gpm	(0,5)	(0,9)	(1,0)	(1,8)	(2,5)	(3,1)
(L/min)						

Pilot fluid consumption DRF (DFR) max. approx. 0.8...1.2 gpm (3...4,5 L/min)

Pilot fluid consumption DRS (DFR1) max. approx. 0.8 gpm (3 L/min)

Flow loss at $q_{v\text{max}}$ see page 8

Possible control valves to be used on B
(not included in supply of pump)

LS-Mobile control valves

Mobile valve block M4-12 (RE 64278)

Mobile valve block M4-15 (RE 64282)

LUDV-Mobile control valves

Mobile valve block M6-15 (RE 64284)

Mobile valve block M7-22 (RE 64287)

LA... - pressure, flow and power control

Execution of pressure control like DR(G), see pages 9/10.

Execution of pressure and flow control like DRS, see page 11.

In order to achieve a **constant drive torque** with varying operating pressures, the swivel angle and with it the output flow of the pump, is varied in such a manner, that the product of flow and pressure remains constant.

Flow control is possible below the limit of the power curve.

When ordering please state the max. input torque in clear text.

Control data

For technical data of pressure control see page 9.

For technical data of pressure and flow control see page 11.

Pilot fluid consumption max. approx. 0.8 gpm (3,0 L/min)

Flow loss at $q_{V \max}$ see page 8

Combination pumps A10VO + A10V(S)O

Combination pumps offer the possibility to obtain mutually independent hydraulic circuits without the use of a splitter gearbox.

When ordering combination pumps the model codes for the first and the second pump must be joined by a "+" .

Ordering example: A10VO85DFR1/52R-VSC12**K04** + A10VO45DR/52R-VSC11N00

If the second pump is not factory mounted, the simple type designation is sufficient. In this case the delivery of the pump with through drive will include: a shaft coupler and a plastic cover to prevent dirt from entering the through drive opening.

Permissible overhang moment

It is permissible to use a combination of two single pumps of the same size (tandem pump) considering a mass acceleration force of max. 10 g (322 ft/sec²(9,81 m/s²)) without an additional support bracket.

Size		10	18	28	45	63	85
Permissible overhang moment							
static	T_m lb-ft (Nm)	–	–	656 (890)	664 (900)	1010 (1370)	2270 (3080)
dynamic at 10 g (322 ft/sec ² (9,81 m/s ²))	T_m lb-ft (Nm)		–	65 (89)	66 (90)	101 (137)	227 (308)
Weight	m_1 lbs (kg)	18 (8)	25 (11,5)	31 (14)	40 (18)	48,5 (22)	75 (34)
Distance to center of gravity	l_1 in (mm)	–	–	3.19 (81)	3.74 (95)	3.94 (100)	4.8 (122)

m_1, m_2 Weight of pumps [lbs (kg)]

l_1, l_2 Dist. to center of gravity [in (mm)]

$$(T_m = (m_1 \cdot l_1 + m_2 \cdot l_2) \cdot \frac{1}{12 (102)} \quad [\text{lb-ft (Nm)}])$$

Installation notes

Optional installation position. The pump housing must be filled with fluid during commissioning and operation.

In order to obtain a low noise level, all connections (inlet, outlet, pilot pressure and case drain lines) must be linked by flexible members to tank.

Avoid placing a check valve in the case drain line.

The highest of the case drain ports (L ; L_1 or L_2) must be connected to tank with piping material for standard pressure rating suitable for the port sizes.

Vertical installation (Shaft end upwards)

Arrangement inside the reservoir

Before installation fill pump housing, keeping it in a horizontal position.

a) If the min. fluid level is equal to or above the pump mounting face: plug port "L", "L₁" and "S" open; it is recommended to pipe "L₁" and connect a suction pipe to "S" (see fig. 1).

b) If the min. fluid level is below the pump mounting face: pipe ports "L₁" and "S" acc. to fig. 2 "L" plugged. (see also limit of conditions)

Note: to avoid pump damage, remove all protective parts (dust covers, plastic plugs etc.) before installation.

Fig. 1

Arrangement outside the reservoir

Above the reservoir as in fig. 2. Before installation fill pump housing, keeping it in a horizontal position.

Limit of conditions

Min. pump inlet pressure $p_{abs\ min} = 12\ psi\ (0,8\ bar)$ under static and dynamic conditions.

Note: try to avoid mounting above tank in order to obtain a low noise level.

The permissible suction height is a result of the overall pressure loss but may not exceed $h_{max} = 32\ in\ (800\ mm)$ (immersion depth $h_{t\ min} = 7.87\ in\ (200\ mm)$).

Fig. 2

Overall pressure loss

$$\Delta p_{tot} = \Delta p_1 + \Delta p_2 + \Delta p_3 \leq (1 - p_{abs\ min}) = 3\ psi\ (0,2\ bar)$$

Δp_1 : press. loss in pipe due to acceleration of fluid column

ρ = density $[kg/m^3]$

$$\Delta p_1 = \frac{\rho \cdot l \cdot dv}{dt} \cdot 10^{-5} [bar]$$

l = pipe lenght $[m]$

dv/dt = change of fluid velocity inlet $[m/s^2]$

Δp_2 : Pressure loss due to static head

$$\Delta p_2 = h \cdot \rho \cdot g \cdot 10^{-5} [bar]$$

h = height $[m]$

ρ = density $[kg/m^3]$

g = gravity acceleration = $9,81\ m/s^2$

Δp_3 = Line losses (elbows etc.)

Horizontal installation

The pump must be installed in such a manner, that either "L", "L₁" or "L₂" is at the top.

Arrangement inside the reservoir

a) If the min. fluid level is above the top of the pump: plug port "L₁", "L" and "S" open; it is recommended to pipe "L" and connect a suction pipe to "S" (see fig. 3).

b) If the min. fluid level is below the top of the pump: pipe "L" and "S" acc. to fig. 4, "L₁" plugged (see also limit of conditions).

Note: to avoid pump damage, remove all protective parts (dust covers, plastic plugs, etc) before installation.

Fig. 3

Arrangement outside the reservoir

Fill pump housing before commissioning.

Pipe port "S" and the highest of the case drain ports "L", "L₁" or "L₂".

a) Mounting above the tank: see fig. 4. (see also "Limit of conditions")

Fig. 4

b) Mounting below the reservoir: pipe ports "L₁" and "S" acc. to fig. 5, plug port "L".

Fig. 5

Notes

Notes

Notes

General information

- The A10VO pump is designed to be used in open circuits.
- Project planning, assembly and commissioning of the pump require the involvement of qualified personnel.
- The service line ports and function ports are only designed to accommodate hydraulic lines.
- During and shortly after operation, there is a risk of burns on the pump and especially on the solenoids. Take suitable safety precautions, e.g. wear protective clothing
- There may be shifts in the characteristic depending on the operating state of the pump (operating pressure, fluid temperature).
- Tightening torques:
 - The tightening torques specified in this data sheet are maximum values and must not be exceeded (maximum values for screw thread).
Manufacturer's instruction for the max. permissible tightening torques of the used fittings must be observed!
 - For DIN 13 fixing screws, we recommend checking the tightening torque individually according to VDI 2230 Edition 2003.
- The data and information contained herein must be adhered to.
